1)

$$1-1 \quad a_n = \frac{1 \cdot 3 \cdot 5 \cdots (2n+1)}{2 \cdot 4 \cdot 6 \cdots 2n} \quad \text{for } n \geq 1$$

pf)

i) To show the sequence is increasing,

$$a_1 = \frac{3}{2} > 1$$

$$a_2 = \frac{3}{2} \left( \frac{5}{4} \right) > 1$$

$$a_3 = \frac{3}{2} \left( \frac{5}{4} \right) \left( \frac{7}{6} \right) > 1$$

⋮

It is shown that  $\frac{a_n}{a_{n-1}} = \frac{2n+1}{2n} > 1$ , which indicates that the sequence is strictly increasing.

ii) From above, we can notice  $\frac{2n+1}{2n}$ , which is always greater than 1, is multiplied. Therefore, by applying geometric series test, we can assume the series has no upper limit.

$\therefore a_n$  is strictly increasing and not bounded above.

$$1-2 \quad \lim_{n \rightarrow \infty} \frac{1}{n} \left\{ \frac{2 \cdot 4 \cdots 2n}{1 \cdot 3 \cdots (2n-1)} \right\}^2$$

$$\lim_{n \rightarrow \infty} \frac{1}{n} \left\{ \prod_{i=1}^n \frac{2i}{2i-1} \right\}^2 > \lim_{n \rightarrow \infty} \frac{1}{n} \left\{ \prod_{i=1}^n \frac{2i}{2i} \right\}^2 = \lim_{n \rightarrow \infty} \frac{1}{n} = 0$$

2)

2-a Suppose  $\{a_n\}$  is a non-decreasing sequence for  $n \gg 1$ . Then  $a_n \leq a_{n+1}$  for all  $n \geq 1$ .  
 $\Rightarrow \frac{a_{n+1}}{a_n} \geq 1$ , which contradicts  $\lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n} = L < 1$ . Therefore,  $\{a_n\}$  is decreasing for  $n \gg 1$ .

2-b Indirect proof) It is given  $a_n > 0$ , and it is proved that  $\{a_n\}$  is a decreasing sequence.

So not until reaching to the lower bound, 0,  $\{a_n\}$  keeps decreasing.

Direct proof)  $|a_n - 0| < \varepsilon$

$$a_n < \varepsilon$$

$$\frac{1}{a_n} > \frac{1}{\varepsilon}, \therefore \text{there is } n > N \text{ such that } a_n = \varepsilon$$

3) Let  $A = 1 + \frac{1}{4} + \frac{1}{9} + \dots + \frac{1}{3n-2} = \sum_{i=1}^n \frac{1}{3i-2} > \sum_{i=1}^n \frac{1}{3i} = \frac{1}{3} \sum_{i=1}^n \frac{1}{i}$ , and we know  $\sum_{i=1}^n \frac{1}{i} = \infty$ . By the comparison test,  $\sum_{i=1}^n \frac{1}{3i-2}$  also goes to  $\infty$ , and it is known that  $\sum_{n=1}^{\infty} \ln n = \infty$ .

Accordingly, we have the form  $\frac{\infty}{\infty}$ , which we can apply L'Hospital's rule.

$\Rightarrow$  setting  $n \approx x$ ,

$$i) \frac{d}{dx} \left( \sum_{i=1}^x \frac{1}{3i-2} \right)$$

$$= \sum_{i=1}^x \frac{d}{dx} \left( \frac{1}{3i-2} \right)$$

$$= \sum_{i=1}^x \frac{-3}{(3i-2)^2}$$

$$ii) \frac{d}{dx} (\ln x) = \frac{1}{x}$$

$$\Rightarrow \lim_{n \rightarrow \infty} \frac{1 + \frac{1}{4} + \frac{1}{9} + \dots + \frac{1}{3n-2}}{\ln n}$$

$$= \lim_{n \rightarrow \infty} \frac{-3n}{1 + \frac{1}{6} + \frac{1}{9} + \dots + \frac{1}{(3n-2)^2}}$$

$$< \lim_{n \rightarrow \infty} \frac{-3n}{1 + \frac{1}{6} + \frac{1}{9} + \dots + \frac{1}{(3n)^2}} = 0$$
, we can verify the limit is 0; therefore, by the comparison test, the given

equation  $\lim_{n \rightarrow \infty} \frac{1 + \frac{1}{4} + \frac{1}{9} + \dots + \frac{1}{3n-2}}{\ln n}$  also converges

4  $\lim_{n \rightarrow \infty} \cos 3n \stackrel{?}{=} L$

Since  $-1 \leq \cos 3n \leq 1$  for any  $n \geq 0 \in \mathbb{N}$ , we may find infinitely many intervals of length  $\frac{\pi}{2}$  on which  $\cos(3x) \geq \frac{\sqrt{2}}{2} > 0$ , which means that there is at least one integer  $k_i$  within each interval.

(For instance, an integer  $k_i$  could fit between  $x = [\frac{7}{4}\pi, \frac{9}{4}\pi]$ ). This gives a subsequence  $\sin k_i$  such that  $\cos(3k_i) \geq \frac{\sqrt{2}}{2}$ .

Similarly, we can choose an integer  $m_i$  from each of the successive intervals of length  $\frac{\pi}{2}$  on which  $\cos(3x) \leq -\frac{\sqrt{2}}{2}$ , giving a subsequence  $\cos(3k_i)$  such that  $\sin 3k_i \leq -\frac{\sqrt{2}}{2}$ .

We now suppose the limit of  $\cos 3n$  exists. Then by Subsequence Theorem,  $\lim_{i \rightarrow \infty} \cos 3k_i = L = \lim_{i \rightarrow \infty} \cos 3m_i$ .

However, referring to the above conclusions,  $\lim_{i \rightarrow \infty} \cos 3k_i \geq \frac{\sqrt{2}}{2}$  and  $\lim_{i \rightarrow \infty} \cos 3m_i \leq -\frac{\sqrt{2}}{2}$ .

$\therefore$  Because of the restrictions stated,  $\lim_{n \rightarrow \infty} \cos 3n$  does not exist.
